1.INTRODUCTION

1.1 OVERVIEW

Diabetes is a chronic disease with the potential to cause a worldwide health care crisis. However, early prediction of diabetes is quite challenging task for medical practitioners due to complex interdependence on various factors as diabetes affects human organs such as kidney, eye, heart, nerves, foot etc. Data science methods have the potential to benefit other scientific fields by shedding new light on common questions. One such task is to help make predictions on medical data.

This project also aims to propose an effective technique for earlier detection of the diabetes disease.

2.LITERATURE SURVEY:

2.1EXISTING PROBLEM:

In this, we need to diagnostically predict whether or not a patient has diabetes, based on certain diagnostic measurements included in the dataset. Several constraints were placed on the selection of these instances from a larger database. In particular, all patients here are females at least 21 years old of Pima Indian heritage.

The datasets consist of several medical predictor variables and one target variable, Diabetes. Predictor variables include the number of pregnancies the patient has had, their BMI, insulin level, age, and so on.

2.2PROPOSED SOLUTION:

Develop an end-to-end web application that predicts the probability of females having diabetes. The application must be built with Python-Flask or Django framework with the machine learning model trained & deployed on AWS Sagemaker. Create an API Endpoint for the model with the help of API Gateway

and AWS Lambda Service.

3.THEORITICAL ANALYSIS:

3.1. BLOCK DIAGRAM:

3.2. SOFTWARE DESIGNING:

1. Amazon S3
2. AWS API Gateway
3. AWS Lambda
4. Amazon SageMaker

4.EXPERIMENTAL INVESTIGATIONS:

Aws Cloud:

Aws Cloud Provides Many Services Such as Sagemaker,lambda and Api Gateway,etc..

Sagemaker:

Amazon SageMaker is a fully managed service that provides every developer and data scientist with the ability to build, train, and deploy machine learning (ML) models quickly. SageMaker removes the heavy lifting from each step of the machine learning process to make it easier to develop high quality models.

Lambda:

With Lambda, you can run code for virtually any type of application or backend service - all with zero administration. Just upload your code and Lambda takes care of everything required to run and scale your code with high availability. You can set up your code to automatically trigger from other AWS services

Api Gateway:

Amazon API Gateway is an AWS service for creating, publishing, maintaining, monitoring, and securing REST, HTTP, and WebSocket APIs at any scale. API developers can create APIs that access AWS or other web services, as well as data stored in the AWS Cloud . API Gateway creates RESTful APIs that: Are HTTP-based.

7.ADVANTAGES :

1. It helps to detect the diabetics in the earlier stages
2. It helps to easily detects the diabetic

8.APPLICATIONS:

1. Used in early prediction for diabetes for women.
2. We can also use it for predicting heart disease, phenomena, kidney disease
3. We can also use it to predict the medical health condition of the people.

9.FUTURE SCOPE:

This research study has only targeted patients with diabetes. Readmission prediction model needs to be generated for other key health conditions also such as Heart disease, Phenomena, kidney disease etc. in Indian Healthcare system. In

the future studies, planned and unplanned(emergency) readmission needs to be considered.

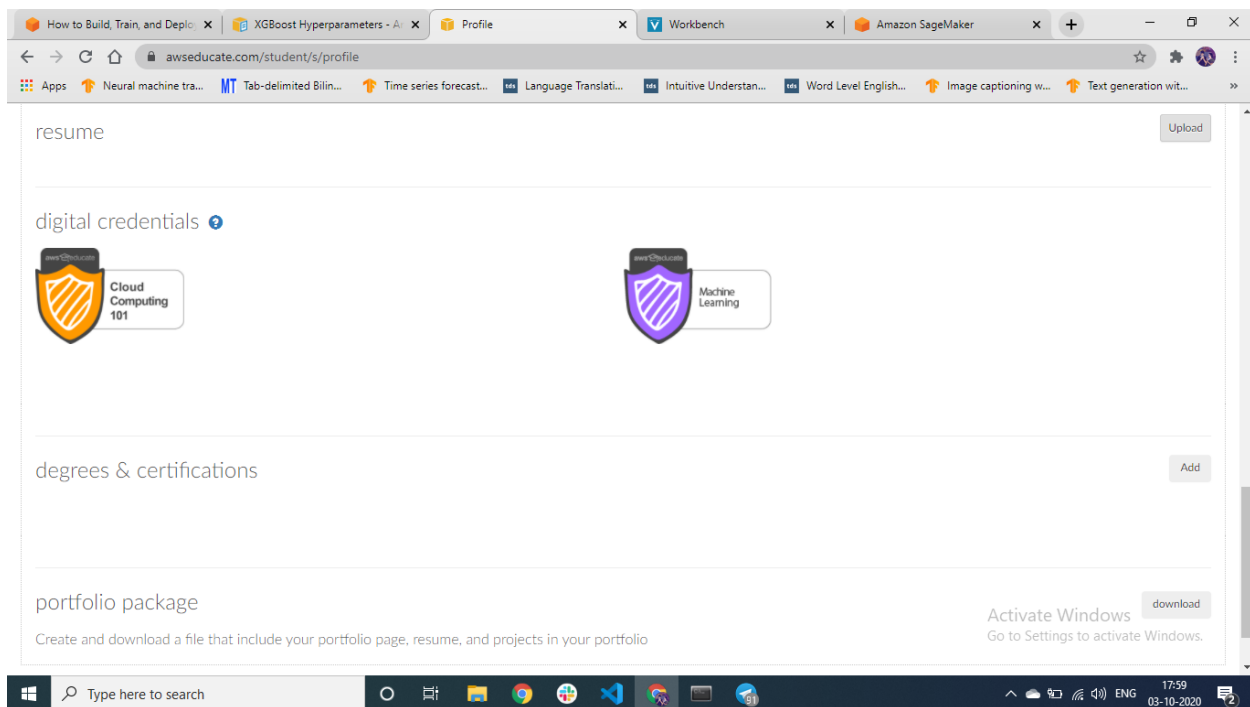

10.CONCLUSION:

Machine learning has the great ability to revolutionize the diabetes risk prediction with the help of advanced computational methods and availability of large amount of epidemiological and genetic diabetes risk dataset. Detection of diabetes in its early stages is the key for treatment. This work has described a machine learning approach to predicting diabetes levels. The technique may also help researchers to develop an accurate and effective tool that will reach at the table of clinicians to help them make better decision about the disease status.

RESTApiCreation:

The screenshot shows the AWS API Gateway console. The breadcrumb navigation is: Amazon API Gateway > APIs > diabetis (9cooc0m619) > Stages > diabetis. The 'diabetis Stage Editor' is open, showing the 'POST' method. The 'Invoke URL' is `https://9cooc0m619.execute-api.us-east-1.amazonaws.com/diabetis`. The 'Settings' tab is selected, showing 'Cache Settings' with 'Enable API cache' disabled and 'Default Method Throttling' with 'Enable throttling' checked. The throttling settings are: Rate 10000 requests per second and Burst 5000 requests. The bottom of the screen shows the Windows taskbar with the date 29-09-2020 and time 19:26.
